Argosy Showcases Latest Products at Broadcast India 2008

Buckinghamshire, United Kingdom, October 1, 2008 — Argosy, leading international suppliers of HD broadcast cables and studio infrastructure products, will be showcasing its latest ranges of products at Broadcast India 2008 (Bombay Exhibition Centre, Mumbai, India 17-19 October 2008), including the latest version of its MDUs, a new audio jack field and a high density high definition video patch panel and a array of video accessories. Also on display at the show will be Argosy's leading range of IMAGE HD video cables that are recognised worldwide for their high performance in broadcast, transmission and production houses facilities.

Showcasing on the Argosy stand (I-901) at Broadcast India will be:

- The new **14-way MDU** makes full use of the 20Amp capability of the Powercon inlet by configuring the outputs in two banks of seven. The two neon-illuminated front panel switches are operated within their 16 amp rating as each is restricted to 10Amps per bank. This technique allows the 14-way series to deliver 20% more output than conventional single switched units. This unit complements the existing popular Argosy 12-port range which includes, sequential and Powercon units.
- New 32-way **High Density HD Video Patch Panel** provide useful performance in excess of 3GHz making them particularly suited to existing single wire standards of SMPTE 292M, the dual link SMPTE 372M and the digital cinema standard of SMPTE 424M. While the high density offers 32 u-links pairs making them ideal for the most demanding video patching application the 1-RU units also maximise space utilisation.

- The new **32 Way Audio Jack Field** is suitable for wiring to audio routers. With 32 inputs and outputs the jacks allow for high density patching with stand B Gauge plugs.
- Useful “gizmo” accessories including: **Video Isolation Transformer, SDI Splitters, HD-SDI Splitters, SDI Isolation Transformers** from leading UK specialist of passive signal enhancement, LEN. All of these accessories are passive, requiring no outside power source although the new **HD-SDI Relay** requires a 5VDC power source to activate the relay. Small in size and economical, these units are very useful for studio and OB applications. Argosy is the international distributor for this new range of accessories.
- Argosy will also display its most popular range of **IMAGE HD video cables**. Surpassing the requirements of SMPTE 292M, the IMAGE range is widely used in worldwide HD installations and has one of the most enviable track records in the industry. IMAGE cables are designed to maximise operational bandwidth while offering the lowest possible return and attenuation loss. With its highly-regarded international reputation among engineers and systems designers alike, IMAGE combines superb quality, reliability and durability with consistent high performance that is perfect for all types of installations however large or small.

About Argosy

Argosy has over 24 years solid experience in advising and supplying studio installation products such as cabling, connectivity solutions, equipment racking, cable management & patching and is recognised as a leading international distributor and expert in this field. Argosy has customers in many countries and has become a “one-stop-shop” for installers of projects from very small to very large. For more information, please go to www.argosycable.com
